

Schlögl RDME: $K=4$ voxels, $D=5.0$ — unstable IC ($n=72$) splitting toward low ($n=31$) and high ($n=162$) [color: $P(n_k=n)^{1/3}$]

n -level V-cycle ($K=4 \rightarrow K=2$), prolong_conditional, $\tau_{\text{pre}}=0.5$. White dashed: stable states ($n=31, n=162$). White dotted: unstable point ($n=72$). Pair structure: pairs (v1,v2) and (v3,v4) — conditional prolong shifts second voxel of each pair.
