

Schlögl RDME: $K=4$, $D=1.0$ — IC: v_1 at unstable point $n=72$, v_2-v_4 empty [color: $P^{1/3}$]

n -level V-cycle ($K=4 \rightarrow K=2$), dynamic- π prolongation. White dashed: stable states ($n=31$, $n=162$). White dotted: unstable point ($n=72$). v_1 escapes the unstable point via reactions; diffusion carries probability to neighboring voxels.
